MODEL LAB · 2026-10-28

Every prior, same slate

The held-out scores that decided which prior is served, then how each one would have ranked today's hitters.

Served (full season)	11	17,800	2.92%	0.5998
served prior	priors compared	held-out plate appearances	held-out HR rate	best AUC · KNN comps

Held-out scores

Fitted on plate appearances before 2026-09-13, scored on the 17,800 that came after (actual HR rate 2.92%). No outcome in the test window was visible during fitting. **Read AUC first** — the slate ranks hitters and takes the top six, so ordering is what matters. Brier and log loss are dominated by the ~3% base rate and barely separate the priors. Metrics are per plate appearance; the probabilities lower down are per game.

PRIOR	AUC	TOP-DECILE LIFT	BRIER	LOG LOSS	CAL. RMSE
Flat league League HR rate as the prior for every hitter.	0.5813	1.62×	0.02826	0.13096	0.00454
KNN comps Prior is the pooled rate of the nearest comparables.	0.5998	1.64×	0.02821	0.12987	0.00605
SVR Support-vector regression on the same feature matrix.	0.5925	1.52×	0.02826	0.13049	0.00693
Random forest Forest regression; a learned similarity metric.	0.5951	1.50×	0.02825	0.13018	0.00678
Core (KNN+SVR) Blend of KNN and SVR, no forest.	0.5998	1.64×	0.02821	0.12987	0.00605
Forest blend KNN + SVR + forest, weights fitted out-of-fold.	0.5998	1.64×	0.02821	0.12987	0.00605
Linear regression Ordinary least squares on the same features.	0.5964	1.58×	0.02825	0.13026	0.00487
Logistic regression Binomial logistic on the per-PA home run outcome.	0.5953	1.60×	0.02830	0.13055	0.00609
Neural net (torch) Two-layer PyTorch MLP, PA-weighted, trained on the same features.	0.5955	1.56×	0.02824	0.13016	0.00503
XGBoost Gradient-boosted trees, depth 3 with subsampling and L2.	0.5945	1.45×	0.02829	0.13055	0.00733

Thin-sample subset

The same held-out window, restricted to hitters with fewer than 100 plate appearances before the cutoff (1,620 PA, actual HR rate 2.35%). For a regular with 600 PA the observed record swamps any prior, so the priors mostly separate here.

slate

Per-game probabilities: each prior's per-PA rate run through this hitter's own plate appearances, park, weather, bullpen and times-through-the-order terms. Only the prior changes across the columns — every other term is held fixed, so a left-to-right spread is the prior disagreeing about the hitter, not the context. Shading grows with the probability.

Slate for 2026-10-28 · model 2026.10.01-stack · built 2026-10-29 05:40:25 · live data 2026-11-07 19:22:57

Built for research and entertainment. Probabilities are estimates, not guarantees; never stake what you cannot afford to lose. Data: MLB Stats API play-by-play, lineups and live scores; ESPN injuries and bios.
